BLOOD BANK MANAGEMENT SYSTEM

Unit Test Report

Execution record and module-level test outcomes

95	95	0	210.0 s
Tests run	Passed	Failed or errored	Suite runtime

Execution details

Executed on 10 Nov 2026 against the Django 5.2.18 project using Python 3.13.5 and SQLite. The test runner created an isolated in-memory test database, applied all migrations, ran the complete suite, and destroyed the database afterward.

Command: coverage run --branch --concurrency=thread --source=accounts,donors,donations,bloodbank_requests,config manage.py test --verbosity=2

Results by area

Area	Coverage in executed tests	Result
Authentication and RBAC	Registration, email and username login, inactive users, password hashing, role restrictions, session timeout and logout	PASS
Donor and receptionist	Profile validation/editing, duplicate detection, walk-in registration, slot creation, capacity, scheduling, dashboard visibility	PASS
Donation and inventory	Screening gates, donation recording, quarantined unit creation, inventory search and availability	PASS
Requests and dispatch	Request validation, decisions, notifications, compatibility, reservation, insufficient stock, expiry, issue and audit	PASS
Concurrency and integrity	Two competing requests cannot reserve the same unit; reservation and issue operations remain atomic	PASS
UI and API behavior	Responsive/accessibility assertions, API error responses and safe error details	PASS

Test run record

Outcome: 95 tests passed, with no failures or errors. The execution log is retained locally at tmp/coverage/test-execution.log. Test fixtures were confined to the disposable test database; the application database was not populated with test records.

Scope note: the automated suite is the executable test inventory available in this repository. The supplied plan names additional manual and load activities without individual case scripts; those are tracked separately in the System Validation Report.
